Suicide Prevention & Response**

UNDERSTANDING CULTURAL FACTORS IN SUICIDE PREVENTION

Suicide rates, attempts and risk factors vary by race and diverse cultures from white middle-aged men to GLBT youth to Pacific Islanders. Increasing understanding and sensitivity to these differences can improve suicide prevention efforts across all populations. Utilizing a foundation of current research and literature, and encouraging audience participation and dialogue, this training explores and considers race, ethnicity, age, gender, sexual orientation/identity, and military culture. Through an in-depth presentation and discussion of cultural characteristics, this workshop provides important insights into culture-specific risk factors and help-seeking behaviors and examines the implications for engagement, prevention and treatment.

WHAT PARTICIPANTS WILL GET FROM THE TRAINING:

- A clear understanding of cultural competency/effectiveness
- An appreciation of stigma and how it affects different cultures
- A review of several high-risk ethnic groups, the cultural attributes that increase suicide risk for these groups, and the implications for help-seeking and treatment
- Examination of suicide risk among middle-aged white men and older adults
- Exploration of studies regarding GLBT youth and factors that increase suicide risk
- An assessment of cultural protective factors
- A review of how cultural factors (family, religion, etc.) impact suicide rates and access to mental health care
- Skills to recognize cultural risk factors and take positive action steps to effectively promote help-seeking and mental health treatment among these high risk groups
- An understanding of the importance of cultural effectiveness to effective community-based suicide prevention efforts
